Dairy-Herd-Improvement Letter

ARS-44-16
(Vol. 33, No. 12)

December 1957

EARTAG IDENTIFICATION OF GRADE DHIA ANIMALS

At the request of the ADSA Records Committee, the DHIA rules relative to the identification of animals is again called to the attention of DHIA Supervisors and leaders in the DHIA program.

DHIA Rule 3, Identification of Animals, (Revised June 1956) states, "Every dairy animal in DHIA herds must be positively identified and recorded on registry page DHIA-16 of the owner's herd-record book within 60 days after entering the herd by birth or purchase. Acceptable identification shall be (1) registration numbers, or (2) old or new Series DHIA or ABA eartag numbers, or (3) new uniform disease eradication and control eartag numbers. (State code, 3-letter prefix, 4 digits.) Tattoo numbers are acceptable on purebred animals as temporary identification until the animals enter the milking herd."

Compliance with this rule is necessary if records are to be processed satisfactorily at the various punch-card computing centers and if the lactation records are to be used to prove DHIA sires when all sire proving work is placed on high-speed electronic data processing equipment.

It is recommended:

1. "All two-year-old grade cows (first calf) and all grade cows with records being reported for the First Time must be identified with the new DHIA, ABA or disease control eartag (State code, 3-letter prefix, 4 digit.)

All cows in new herds coming into the Standard DHIA record plan must also be identified with the new eartags (DHIA, ABA or disease control - State code, 3-letter prefix, 4 digit number)

2. "Old DHIA (State code, 2-letter prefix, 4 digit) eartag numbers are satisfactory identification because there is no duplication in this controlled series of numbers."

3. Old disease control eartag numbers of cows with records previously reported under that number will be accepted as satisfactory identification. But, if there is any doubt whatever about a previous record being reported for a cow, only eartag numbers of the old or new DHIA or the new disease control series (State code, 2-letter prefix, 4 digit) should be used for reporting her identification.
4. For herds whose records are computed on punch card calculating equipment in computing centers the following procedure is recommended subject to the approval of the State Extension Dairyman in each State:
 - (a) As herds are placed on the EDPM records system all grade animals are given an eartag number of the new DHIA series (State code, 3-letter prefix, 4 digits). (Many States are now following the procedure.)
 - (b) Once the identification number of a cow is reported and set up in the EDPM system that number becomes and will remain the reporting number of the cow as long as she remains in the herd. Should it become necessary to retag a cow the original eartag number remains her reporting number for all purposes and the new eartag number is recorded on the registry page of the Herd Record Book and is used in the same manner as a tattoo number is used for registered cows. The original eartag number shall also be used when a cow is reported as a dam with the 718 record of her daughter. (This procedure will eliminate the expense of changing the EDPM records in the computing center each time an animal is retagged.)
5. 718 records with disease control eartag numbers are not accepted for use in proving sires unless the cow has a previous record reported under the same identification number. Again, in case of any doubt whatever regarding a previous record having been reported, give the cow an eartag number of the new DHIA series. (State code, 3-letter prefix, 4 digit number.)

DHIA PROVED-SIRE RECORDS TABULATED IN NOVEMBER 1957

Following is a list of 411 sires whose records were tabulated or retabulated by the Dairy Cattle Research Branch in November 1957. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
